

Indexes =

Indices

Indexes

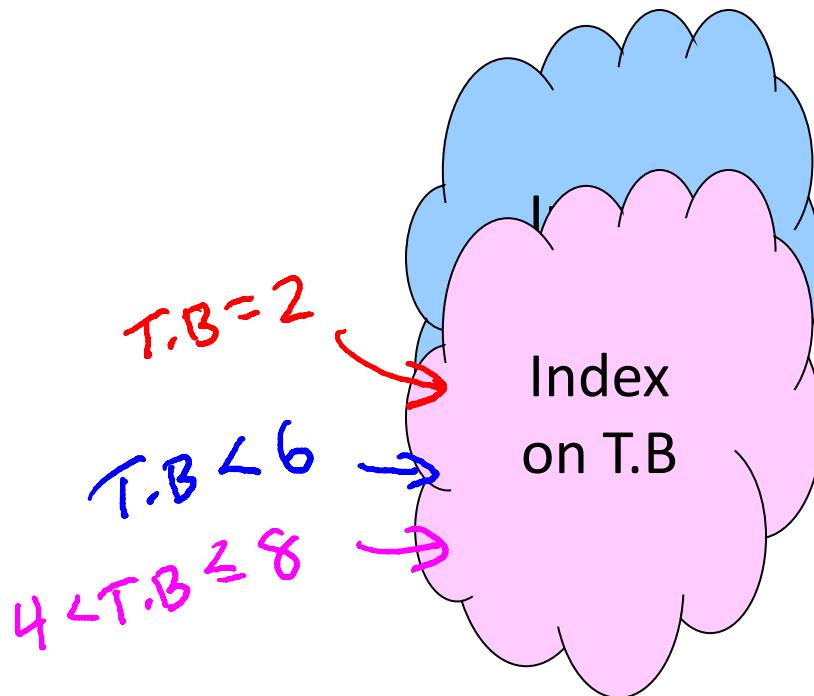

- Primary mechanism to get improved performance on a database
- Persistent data structure, stored in database
- Many interesting implementation issues
But we are focusing on user/application perspective

Functionality

| T | A | B | C |
|---|-----|-----|-----|
| 1 | cat | 2 | ... |
| 2 | dog | 5 | ... |
| 3 | cow | 1 | ... |
| 4 | dog | 9 | ... |
| 5 | cat | 2 | ... |
| 6 | cat | 8 | ... |
| 7 | cow | 6 | ... |
| | ... | ... | ... |

Functionality

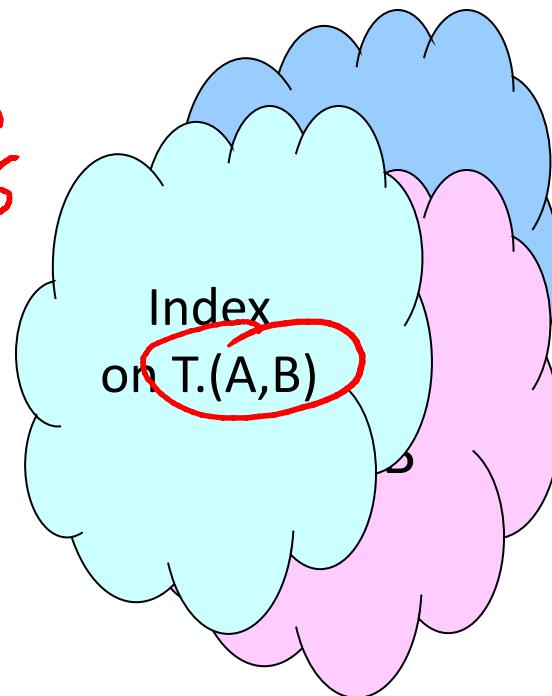

| T | A | B | C |
|---|-----|-----|-----|
| 1 | cat | 2 | ... |
| 2 | dog | 5 | ... |
| 3 | cow | 1 | ... |
| 4 | dog | 9 | ... |
| 5 | cat | 2 | ... |
| 6 | cat | 8 | ... |
| 7 | cow | 6 | ... |
| | ... | ... | ... |

Functionality

$T.A = \text{'cat'}$
and $T.B > 5$

$T.A < \text{'d'}$
and $T.B = 1$

| | A | B | C |
|---|-----|-----|-----|
| 1 | cat | 2 | ... |
| 2 | dog | 5 | ... |
| 3 | cow | 1 | ... |
| 4 | dog | 9 | ... |
| 5 | cat | 2 | ... |
| 6 | cat | 8 | ... |
| 7 | cow | 6 | ... |
| | ... | ... | ... |

Utility

- Index = difference between full table scans and immediate location of tuples
 - * Orders of magnitude performance difference

- Underlying data structures

- Balanced trees (B trees, B+ trees)
 - Hash tables

$A = \sqrt{v}$ $v_i \leq A \leq \sqrt{2v}$

$A < \sqrt{v}$

\hookrightarrow logarithmic ✓

\hookrightarrow constant ✓

```
Select sName  
From Student  
Where SID = 18942
```

Index on SID

Many DBMS's build indexes automatically on
PRIMARY KEY (and sometimes UNIQUE) attributes

```
Select SID  
From Student  
Where sName = 'Mary' And GPA > 3.9
```

Index on sName \leftarrow hash or tree

Index on GPA \leftarrow tree-based

" (*sName, GPA*)

```
Select sName, cName  
From Student, Apply  
Where Student.SID = Apply.SID
```

Index ————— Index

Query planning & optimization

Downsides of Indexes

- 1) Extra space – marginal
- 2) Index creation – medium
- 3) Index maintenance – can offset benefits

Picking which indexes to create

Benefit of an index depends on:

- Size of table (and possibly layout) ✓
- Data distributions ✓
- Query vs. update load ✓

"Physical design advisors"

Input: database (statistics) and workload

Output: recommended indexes

Benefits
outweigh
drawbacks

- Database statistics
- Query or update
- Indexes

Query
Optimizer

Best execution plan
with estimated cost

SQL Syntax

Create Index IndexName on T(A)

Create Index IndexName on T(A₁,A₂,...,A_n)

Create Unique Index IndexName on T(A)

Drop Index IndexName

Indexes
